BMI engineering developed a series of bearings that are dimensionally interchangeable with conventional double row spherical rollers

CASE STUDY: Single Row Sphericals

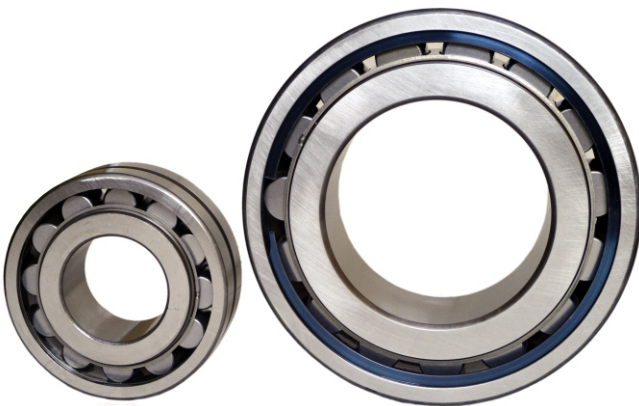

BMI has developed single row sphericals similar to McGill in 22200 series and 22300 series.

This series is **available with and without seals** but normally with seals is preferred to get maximum life.

Also a single row of large roller results in **increased dynamic load rating and greater misalignment** as well.

This series is exactly interchangeable with conventional double row spherical roller bearings dimensionally. Sealing ensures protection from contamination in severe environment for longer life.

For any non - standard developments feel free to reach out to BMI team on sales@bmibearings.com and we will be glad to assist you.
